

# Habitat Selection of Greater Prairie-Chicken Broods in a Heterogeneous Grassland

David Londe<sup>†</sup>, R.D. Elmore, S.D. Fuhlendorf, and C.A. Davis

Oklahoma State University

<sup>†</sup>david.londe@okstate.edu

# Habitat Selection

Habitat-use influenced by scale and time

Hierarchical process: Subunits within larger habitat units

Trade-offs between multiple resource needs

Food

Predator Avoidance

Thermal Conditions (Both Hot and Cold)

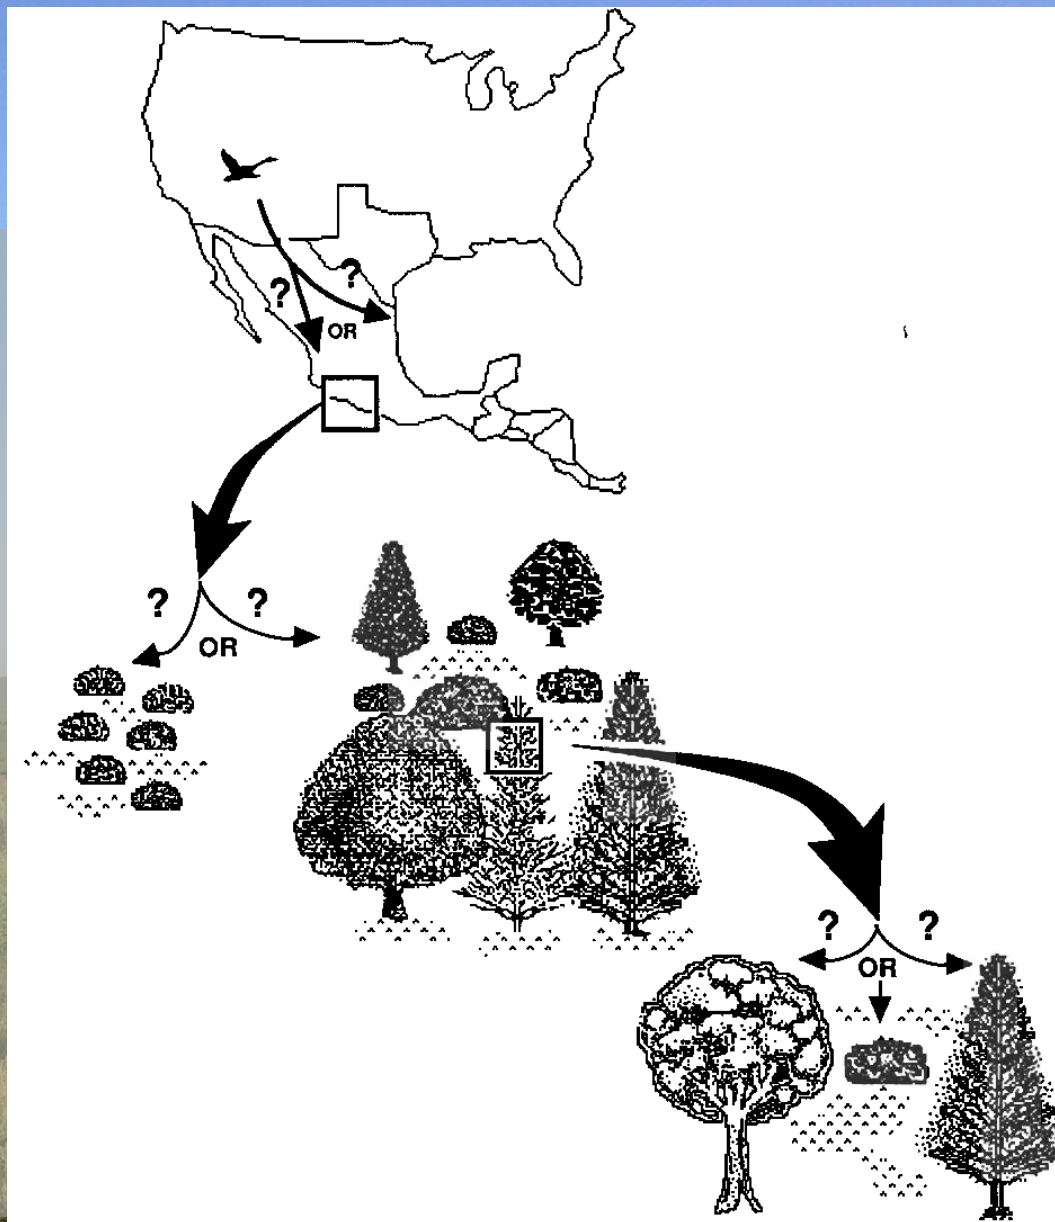

FIGURE 5. Hierarchical decision-making process of habitat selection by migratory birds [from Hutto, 1985].

# Greater Prairie-Chicken Broods (*Tympanuchus cupido*, GRPC)

High energy demands due to rapid growth

Sensitive to weather

Low mobility

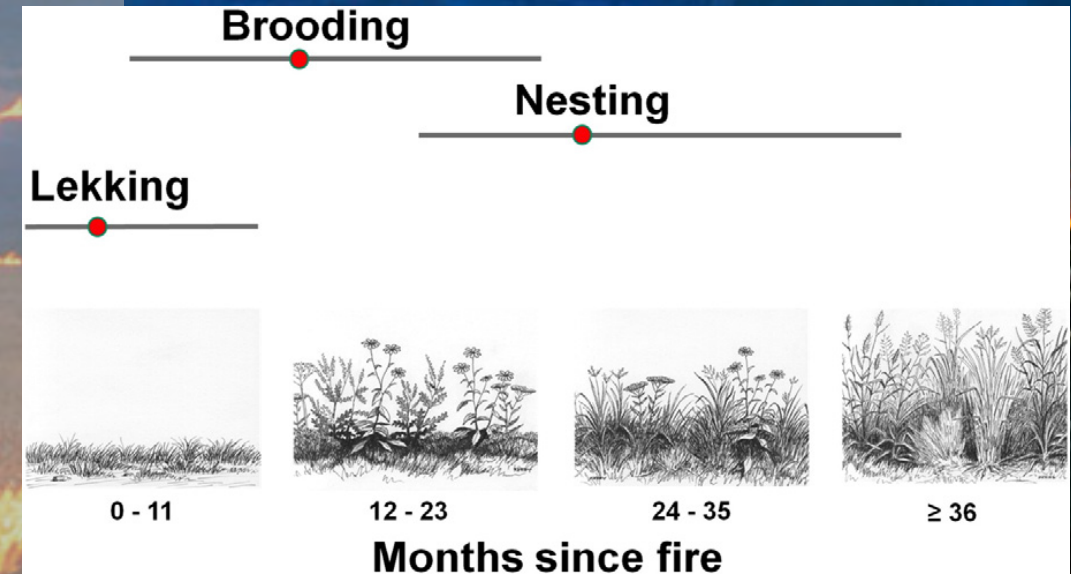

# Grassland Heterogeneity

Fire and grazing drives vegetation structure

Management that emphasizes heterogeneity becoming more common

Different patches used by GRPC through life-cycle

# Objectives

Evaluate GRPC brood habitat selection and response to heterogeneity

What factors are important for determining habitat use?

- Vegetation Structure

- Thermal Environment

- Food resources (Invertebrate Biomass and Abundance)

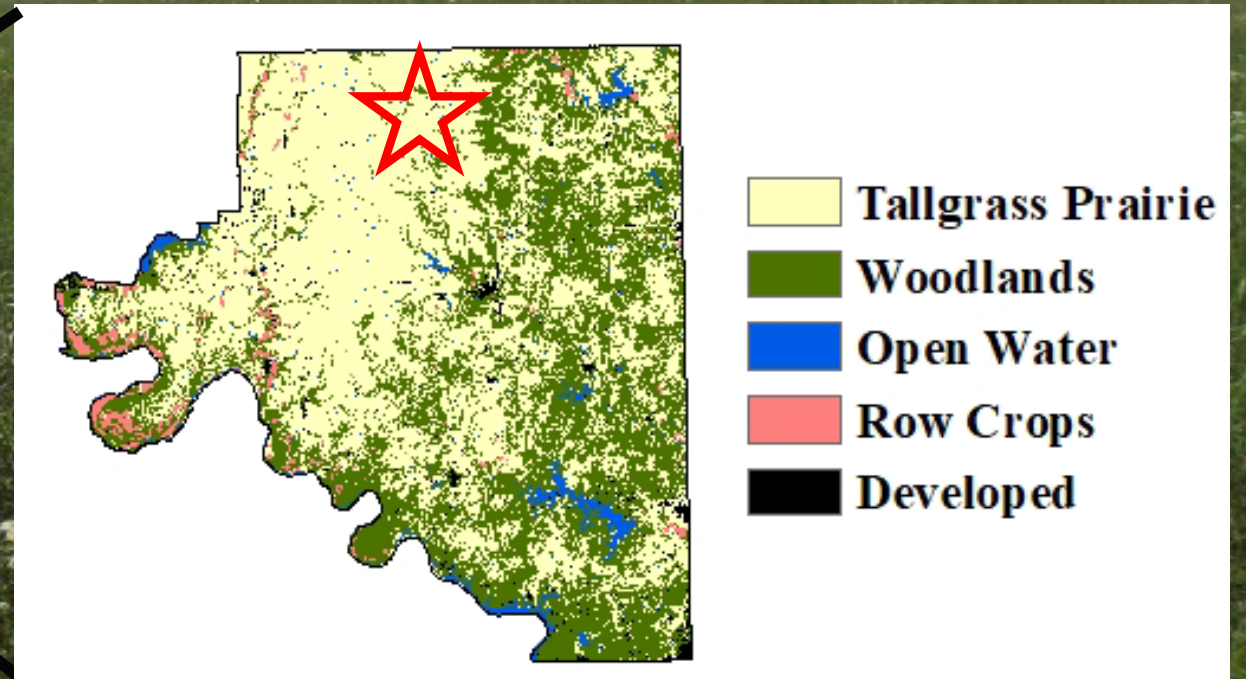

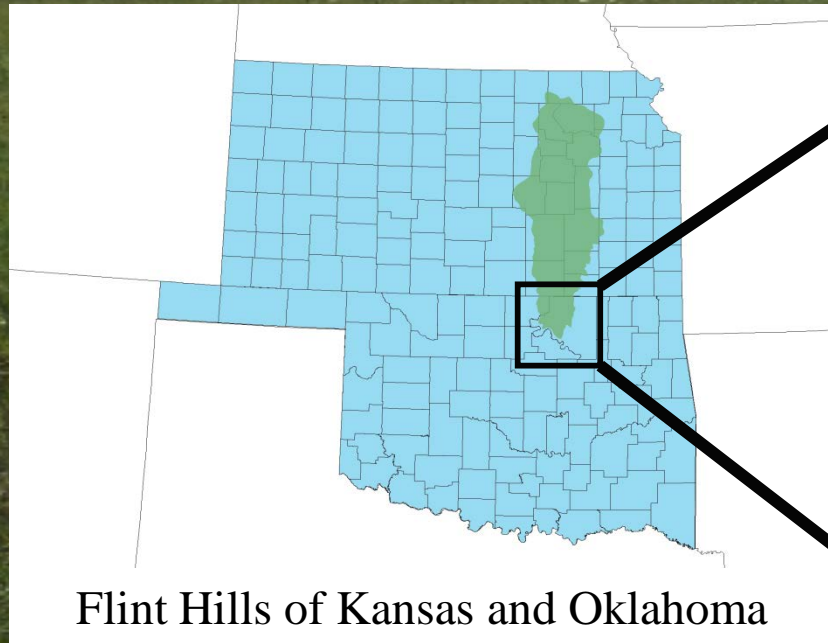

Do broods use different patches for different parts of daily cycle?

# Study Site: Osage County, Oklahoma

Study Site:

Private Cattle Ranches

The Nature Conservancy's Tallgrass Prairie Preserve

# Methods: Capture and Transmitters

Female GRPC captured using walk in funnel traps on leks

22 gram Argos/PPT GPS transmitters (Microwave Telemetry Inc, Columbia, MD, USA)

15 locations per day

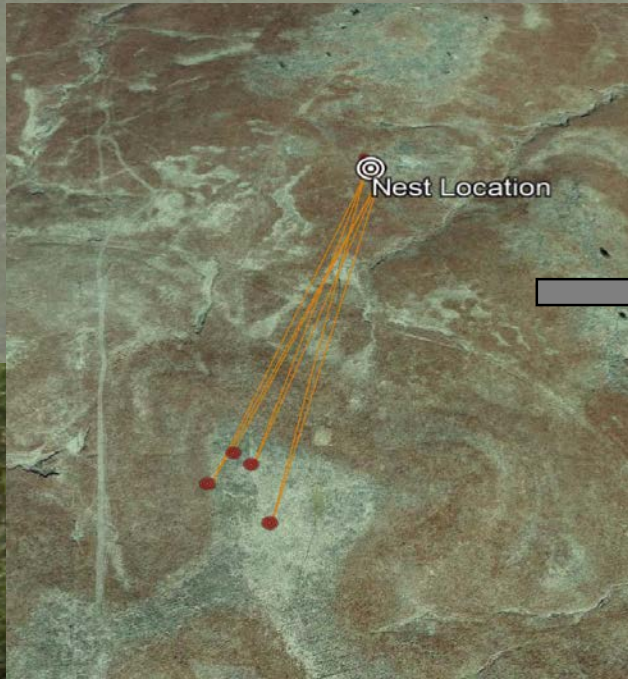

Transmitter error  $\pm$  18-20 meters

# Nest and Brood Monitoring

Monitor nests remotely via Satellite GPS

Conducted weekly brood flushes to monitor survival

# Sampling Design

## Randomly select 4 GPS Locations

2 Morning feeding locations (7:00-10:00)

2 Afternoon loafing locations (13:00-16:00)

Thermal (Black Spheres Tbs with Hobo Data Loggers)

Vegetation

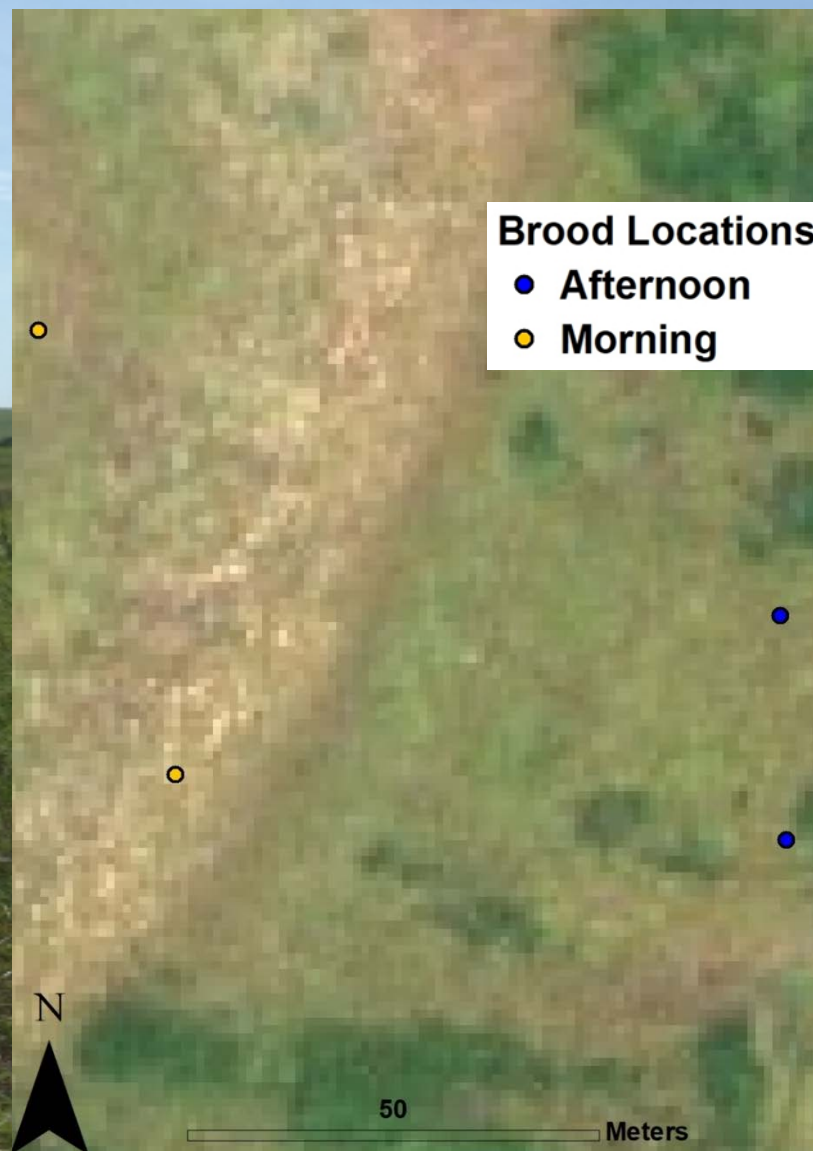

Percent Cover

Vegetation Height

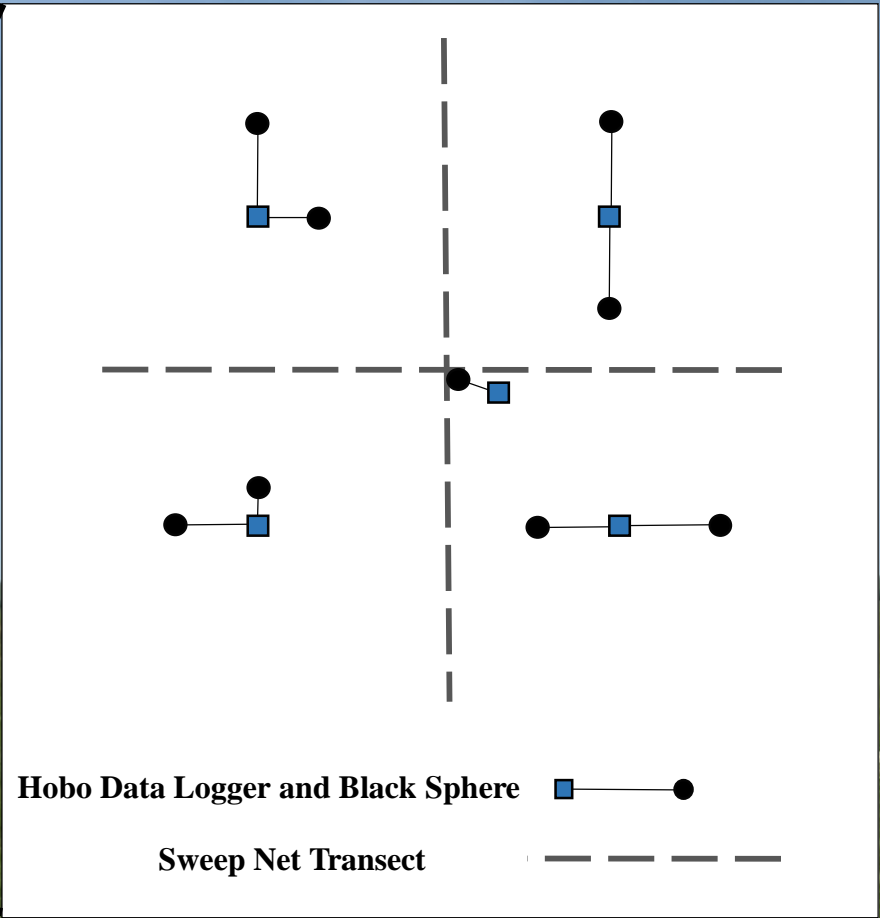

Visual Obstruction (VOR)

Litter Depth

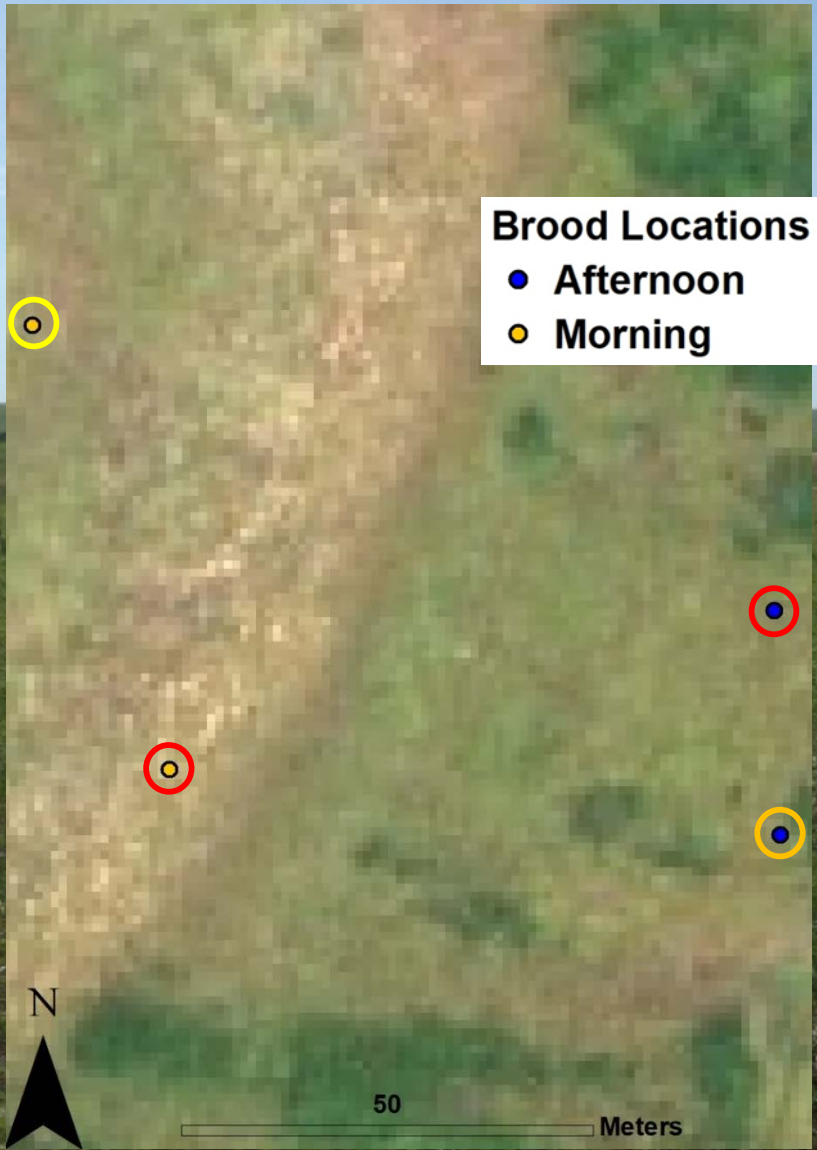

Sweep net Transects

# Sampling Design

# Sampling Design

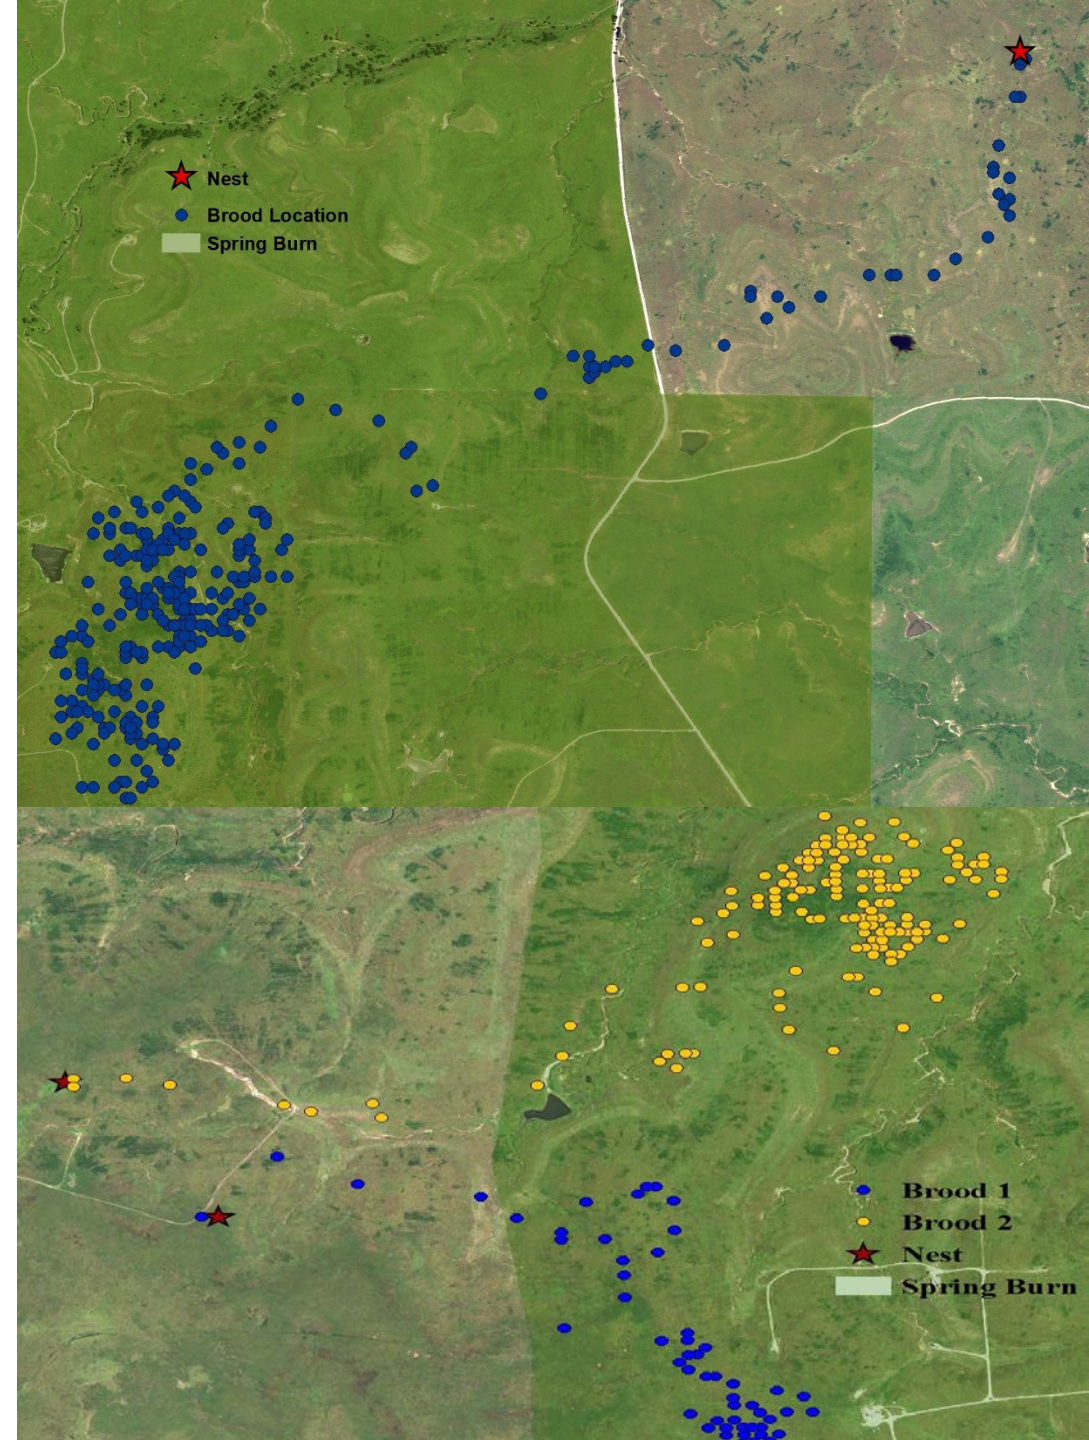

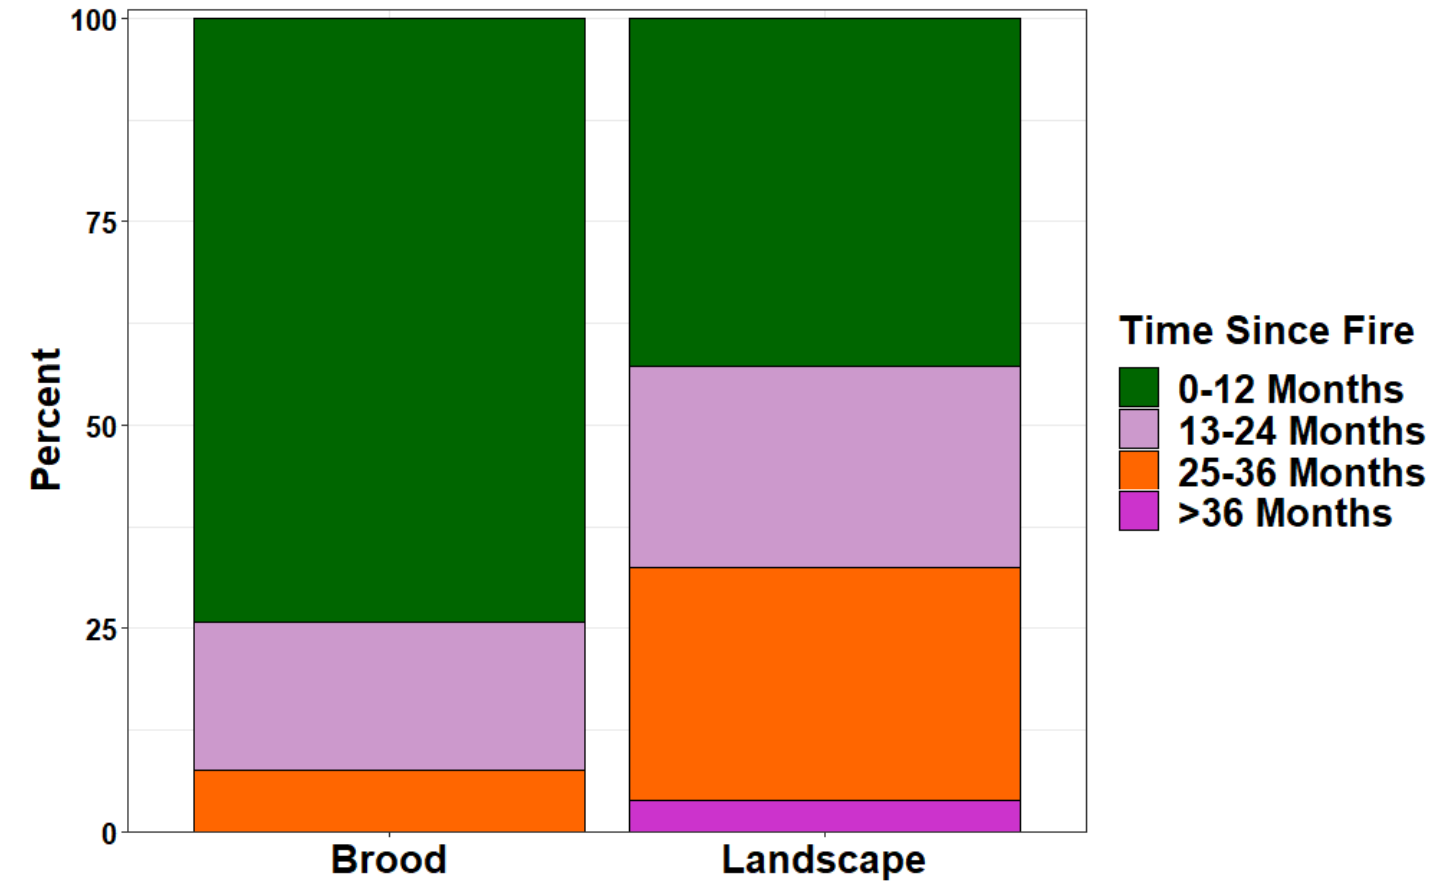

## Locations Randomly Assigned Sample Period

### Sample Times

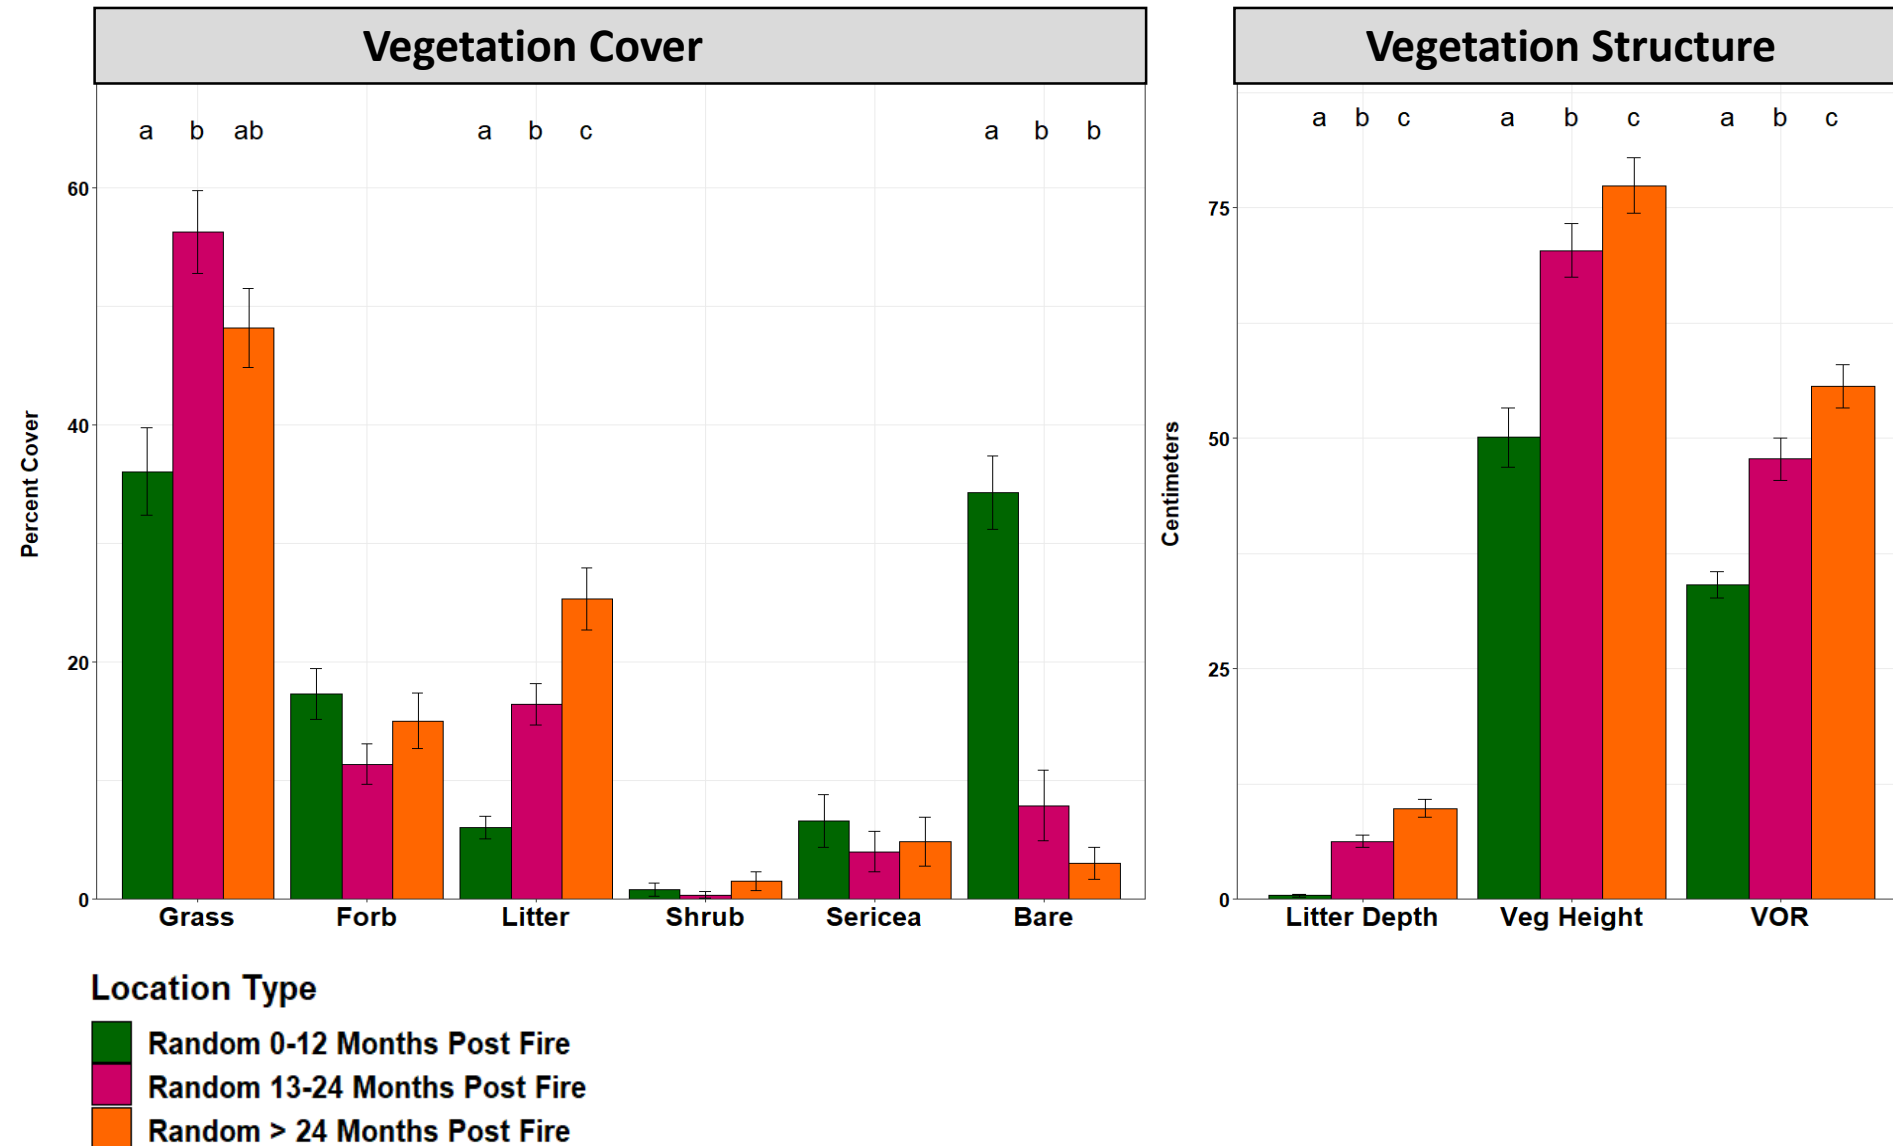

○ Afternoon (12:30-17:00)

○ Morning (6:30-10:30)

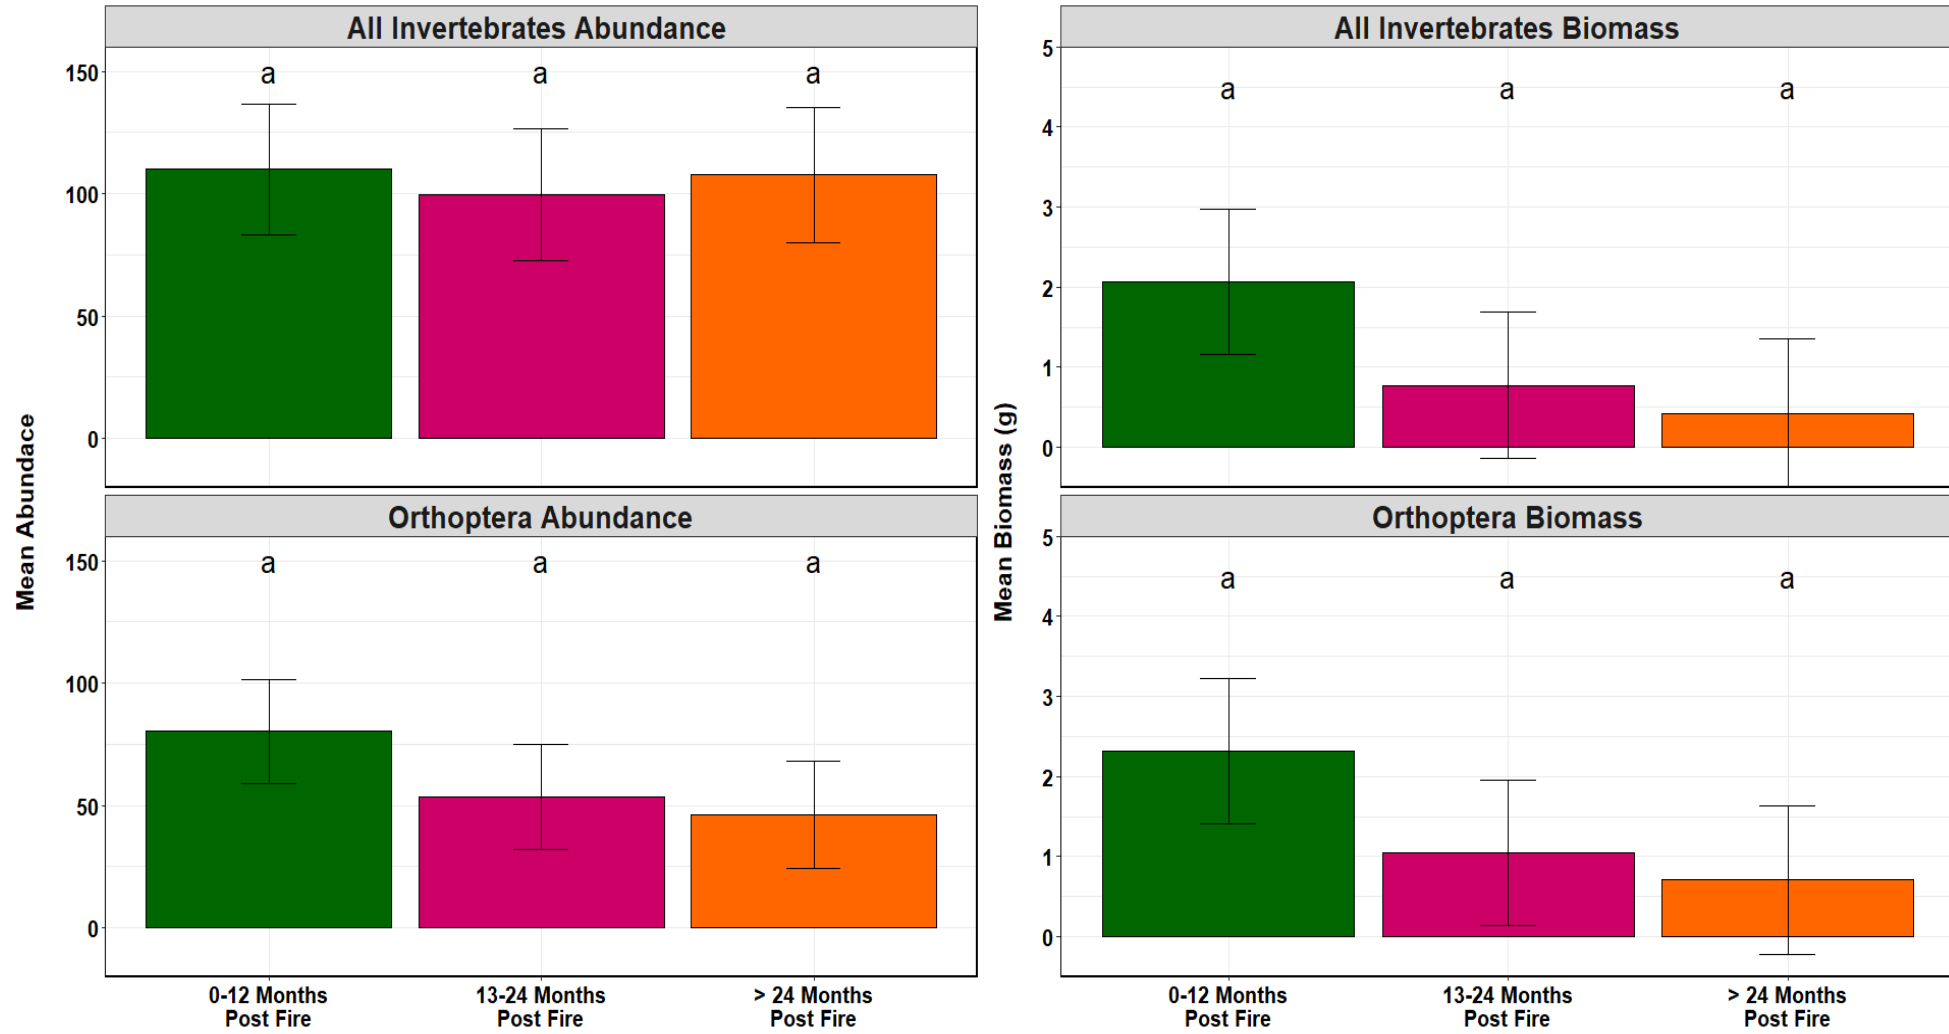

# Patch Level Selection

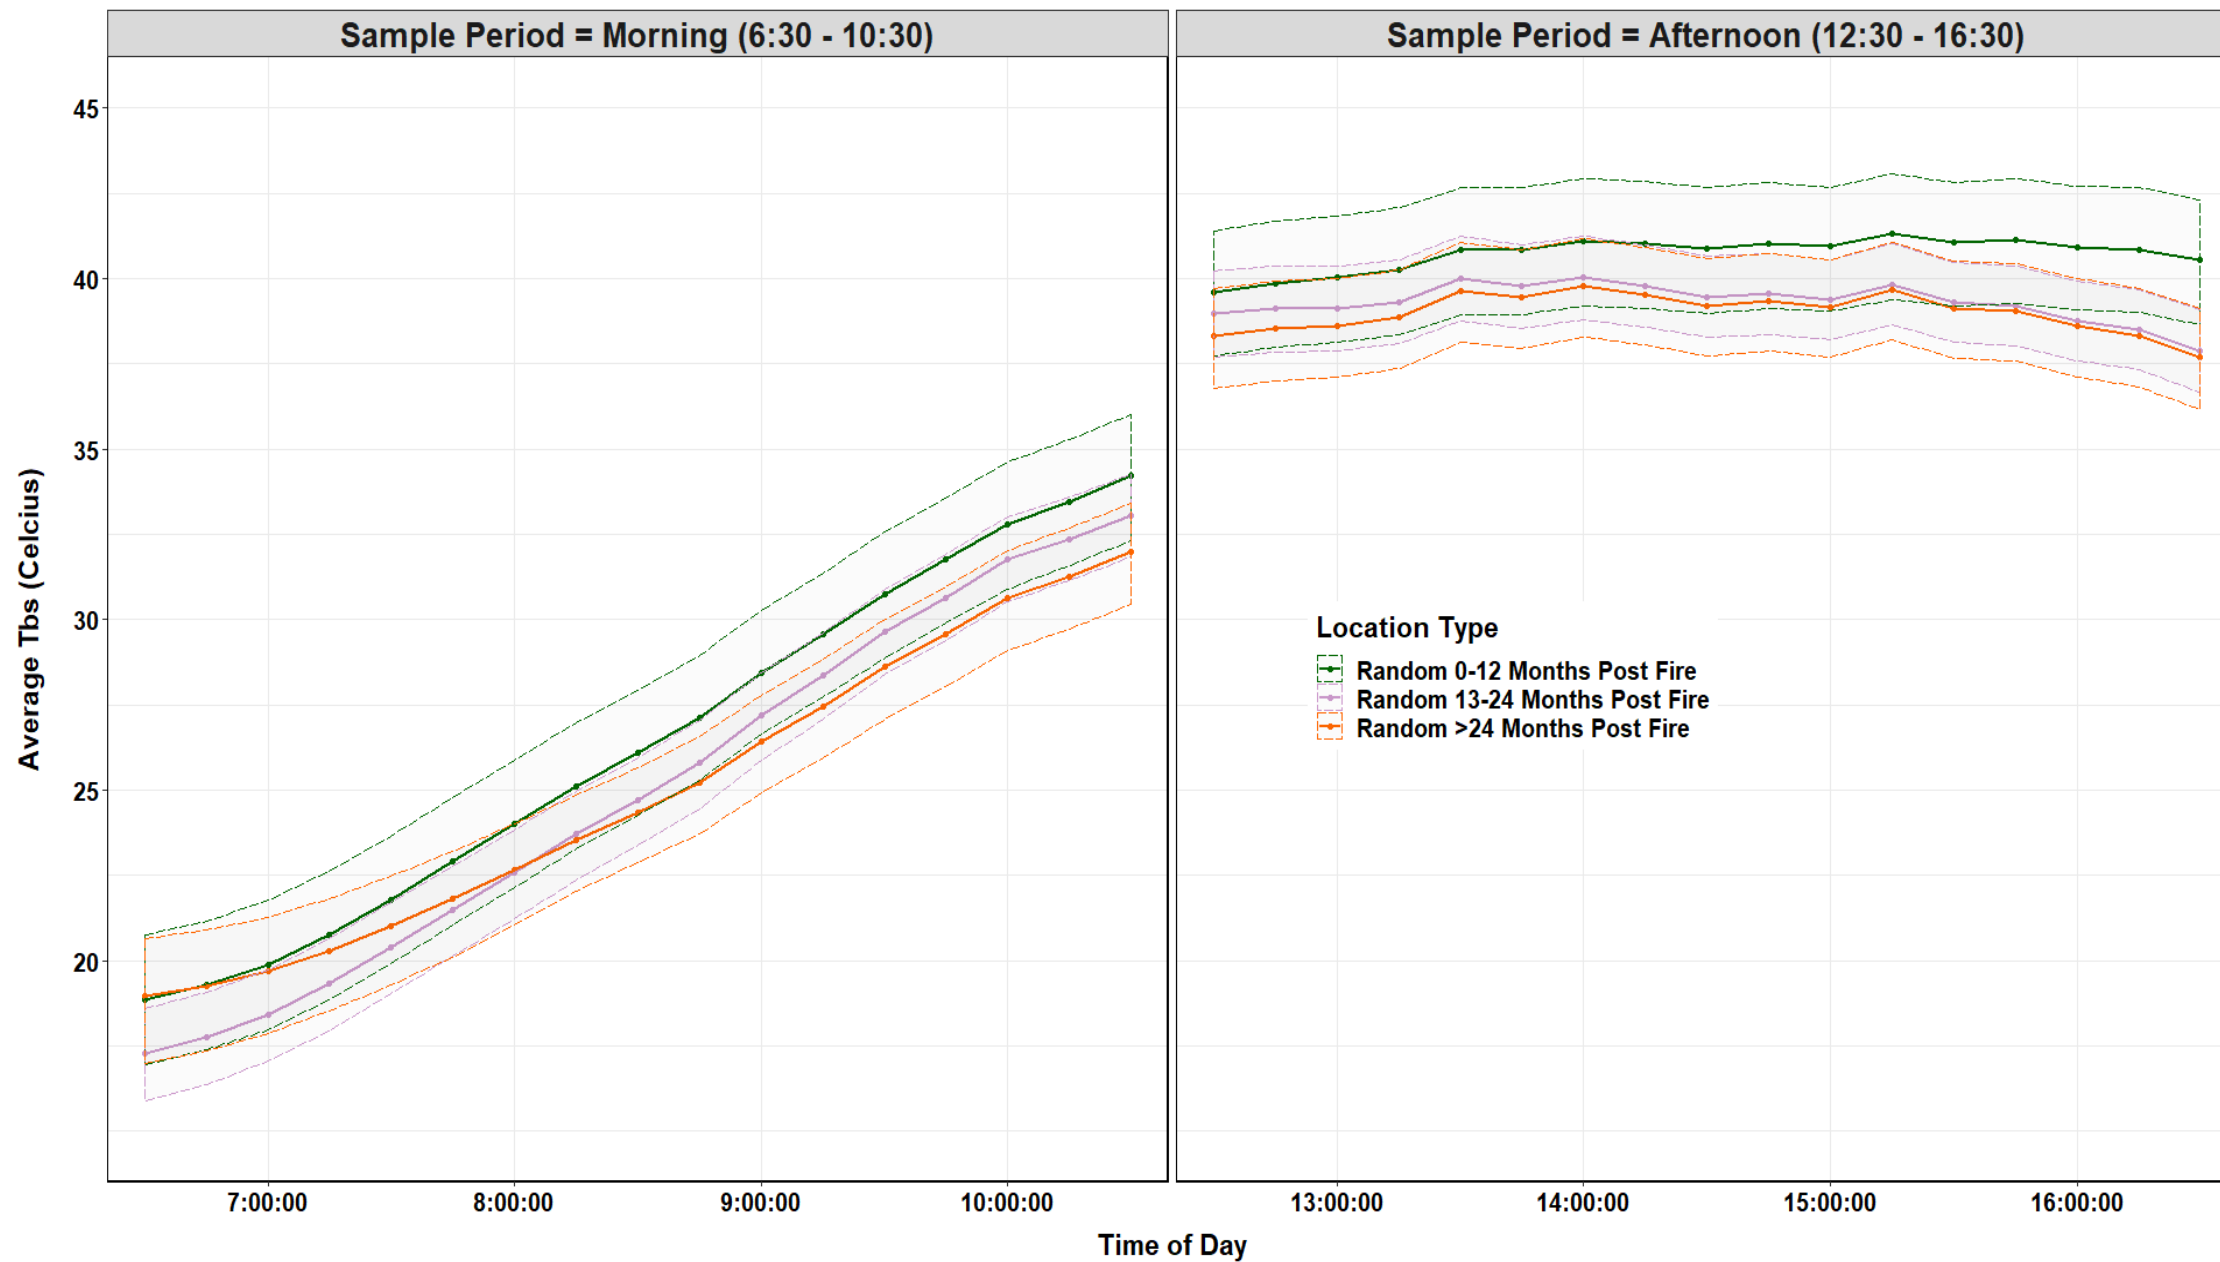

# Patch Level Vegetation Characteristics

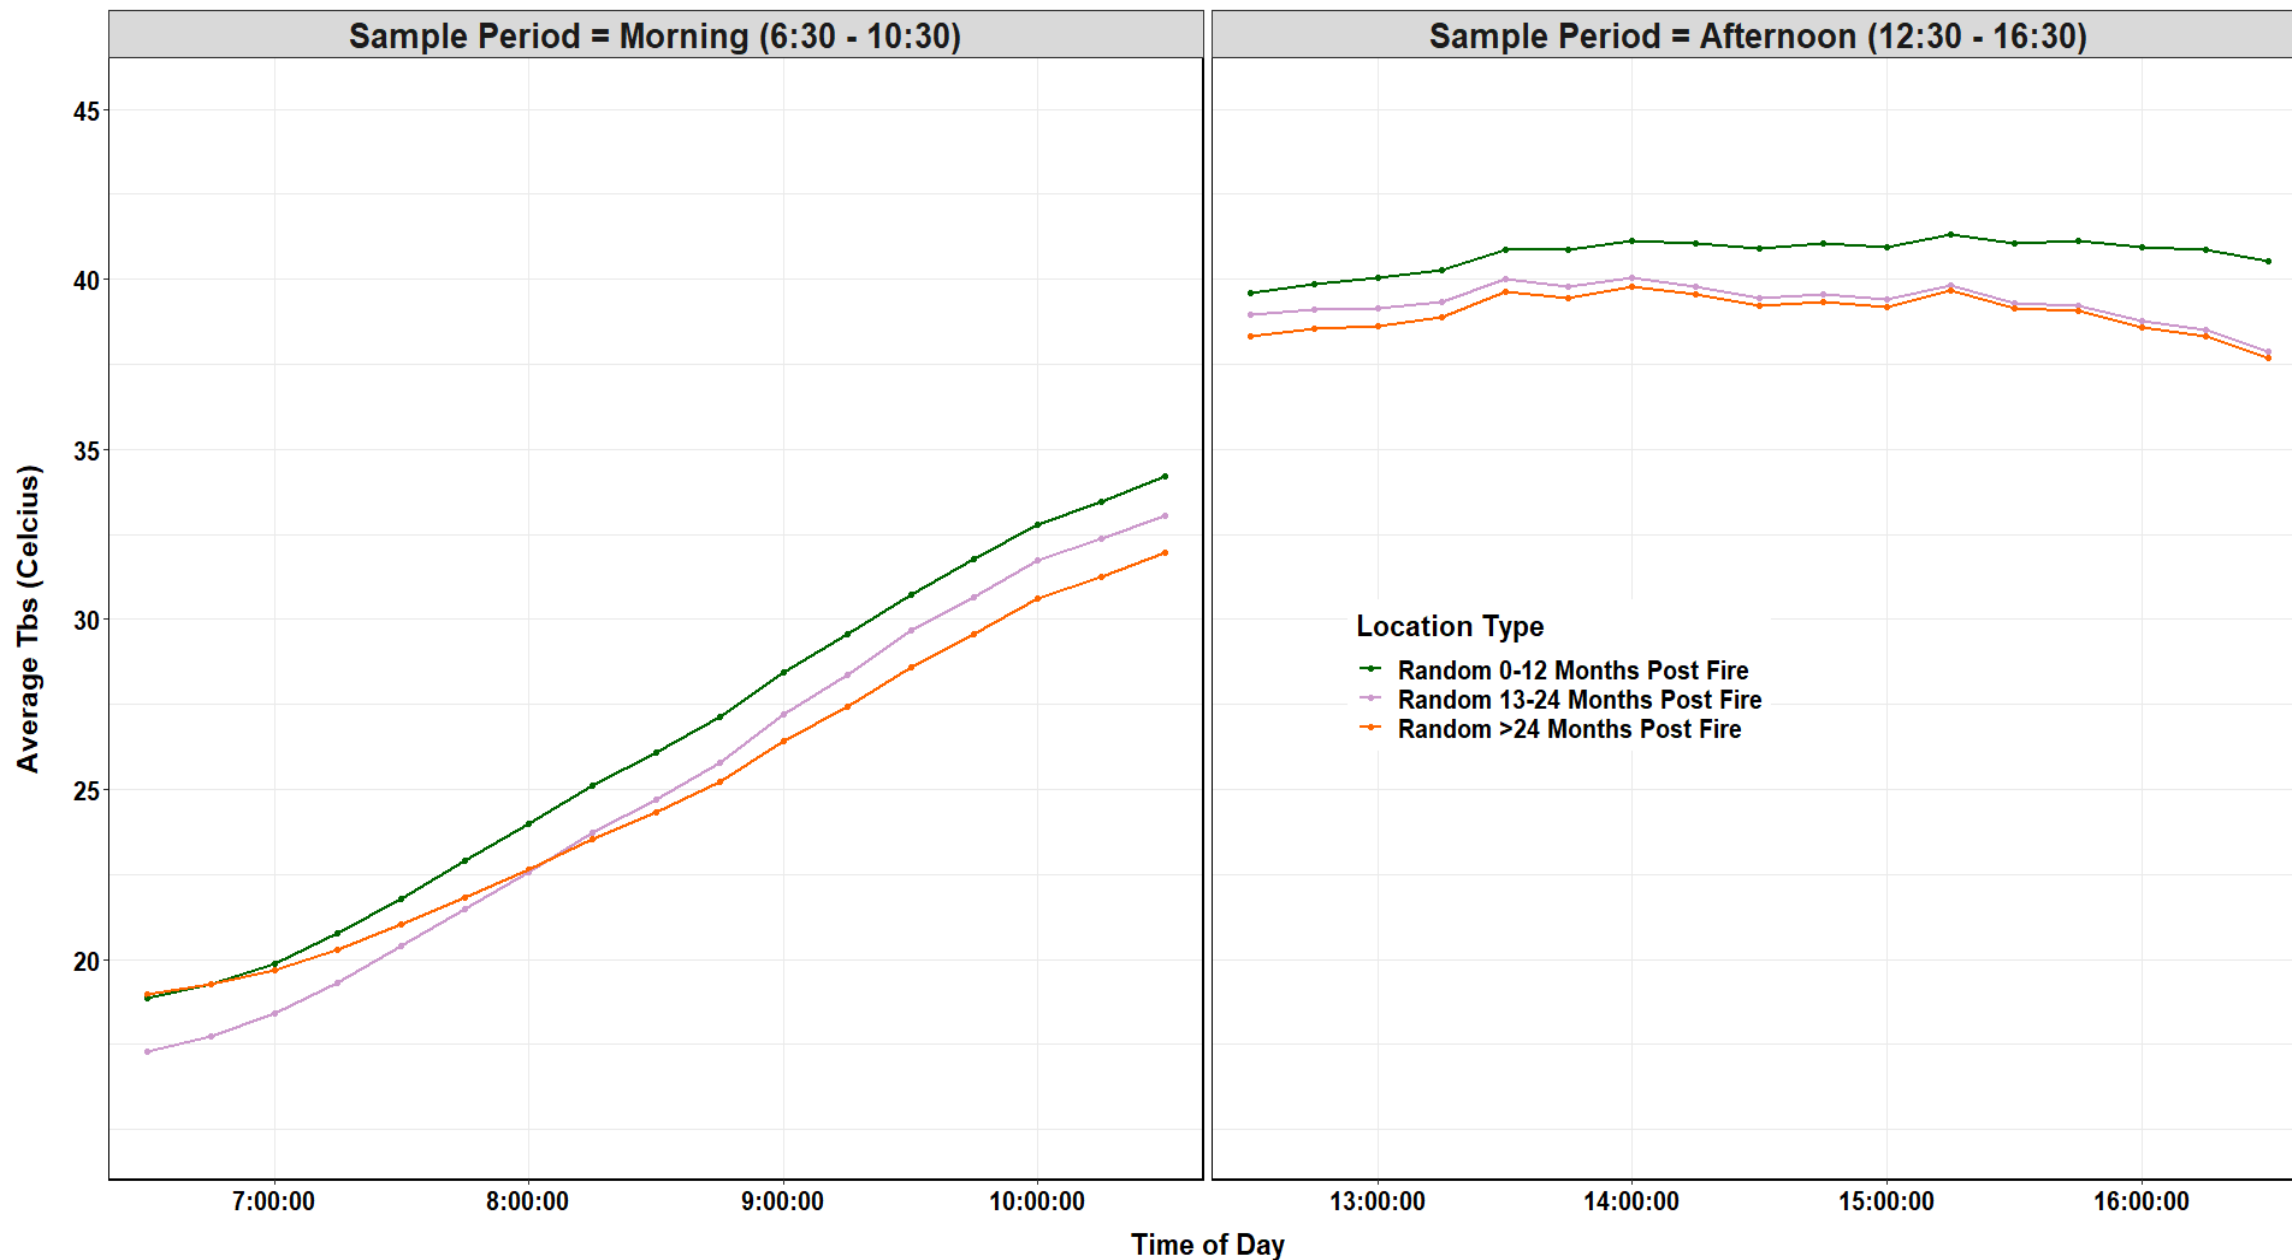

# Patch Level Invertebrates

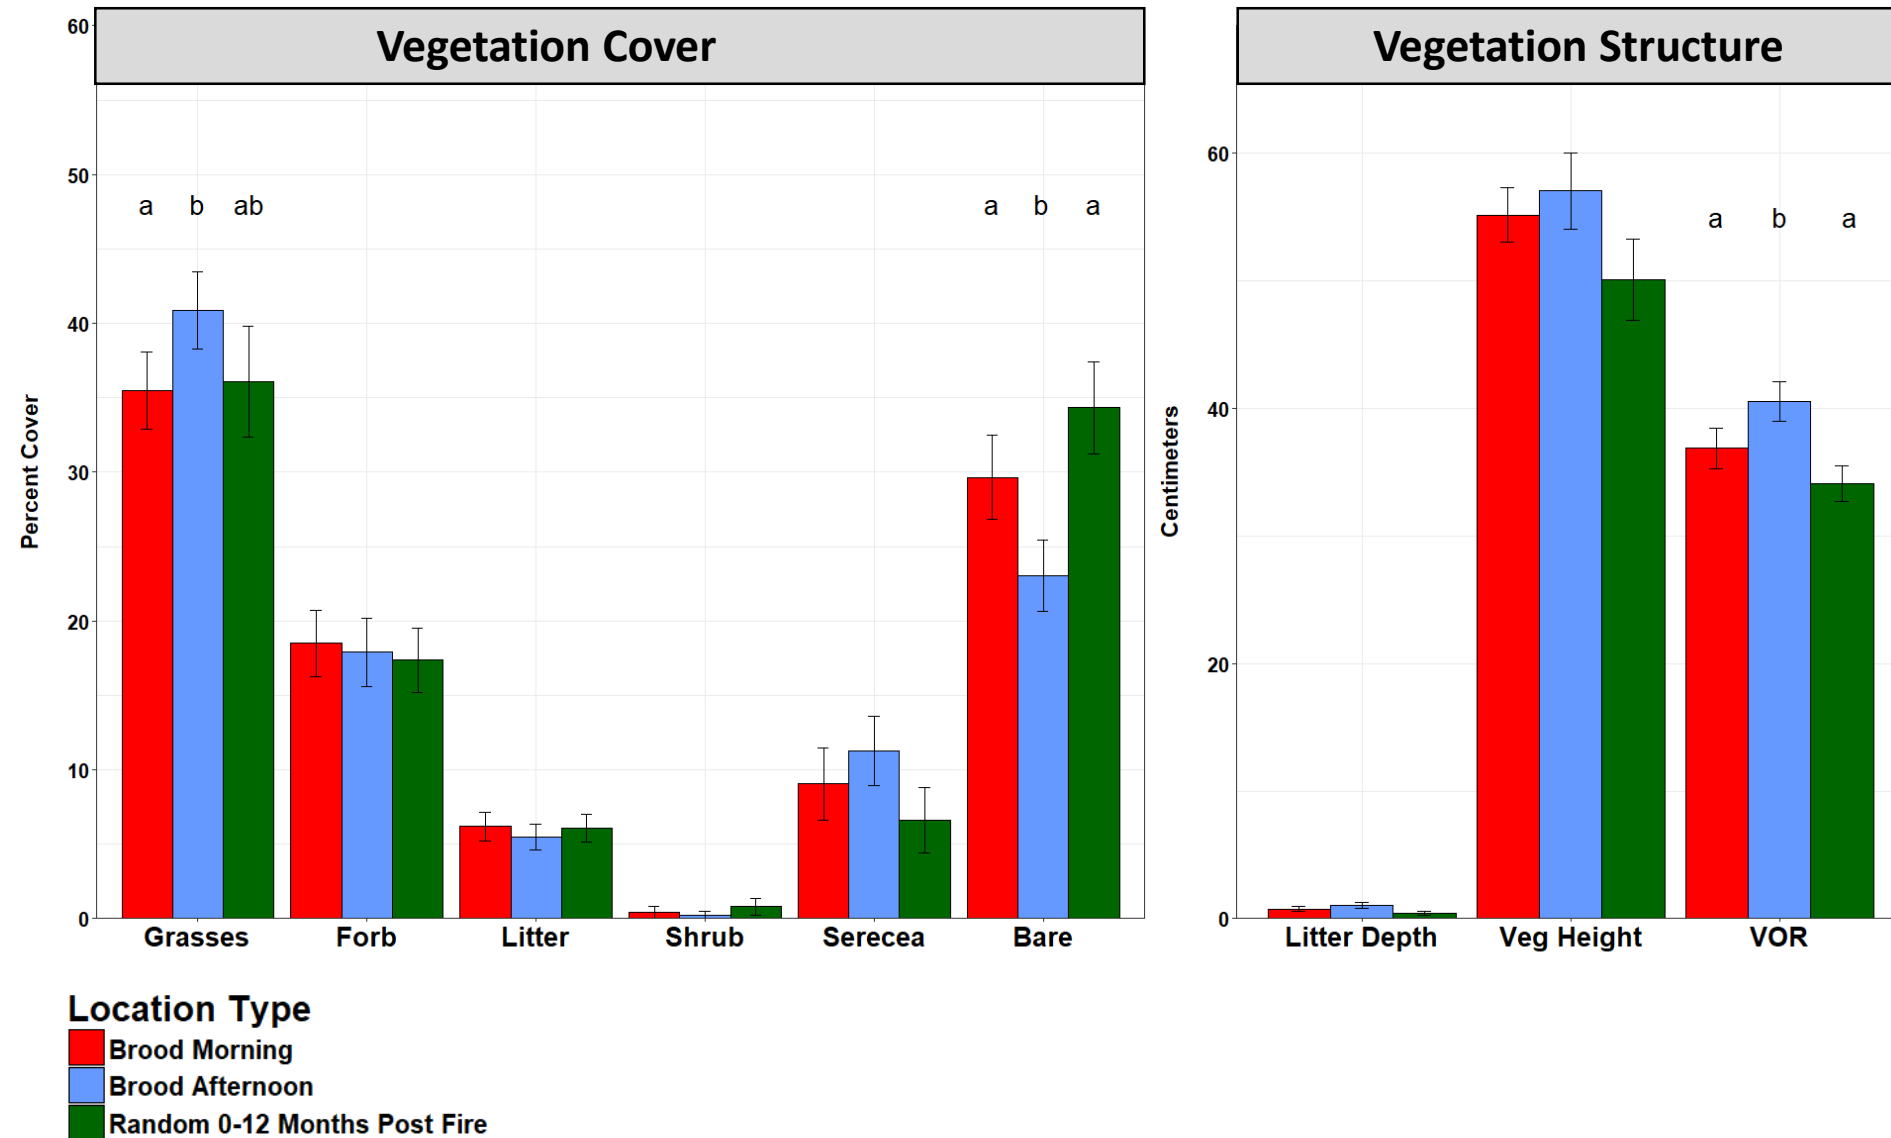

# Patch Level Thermal

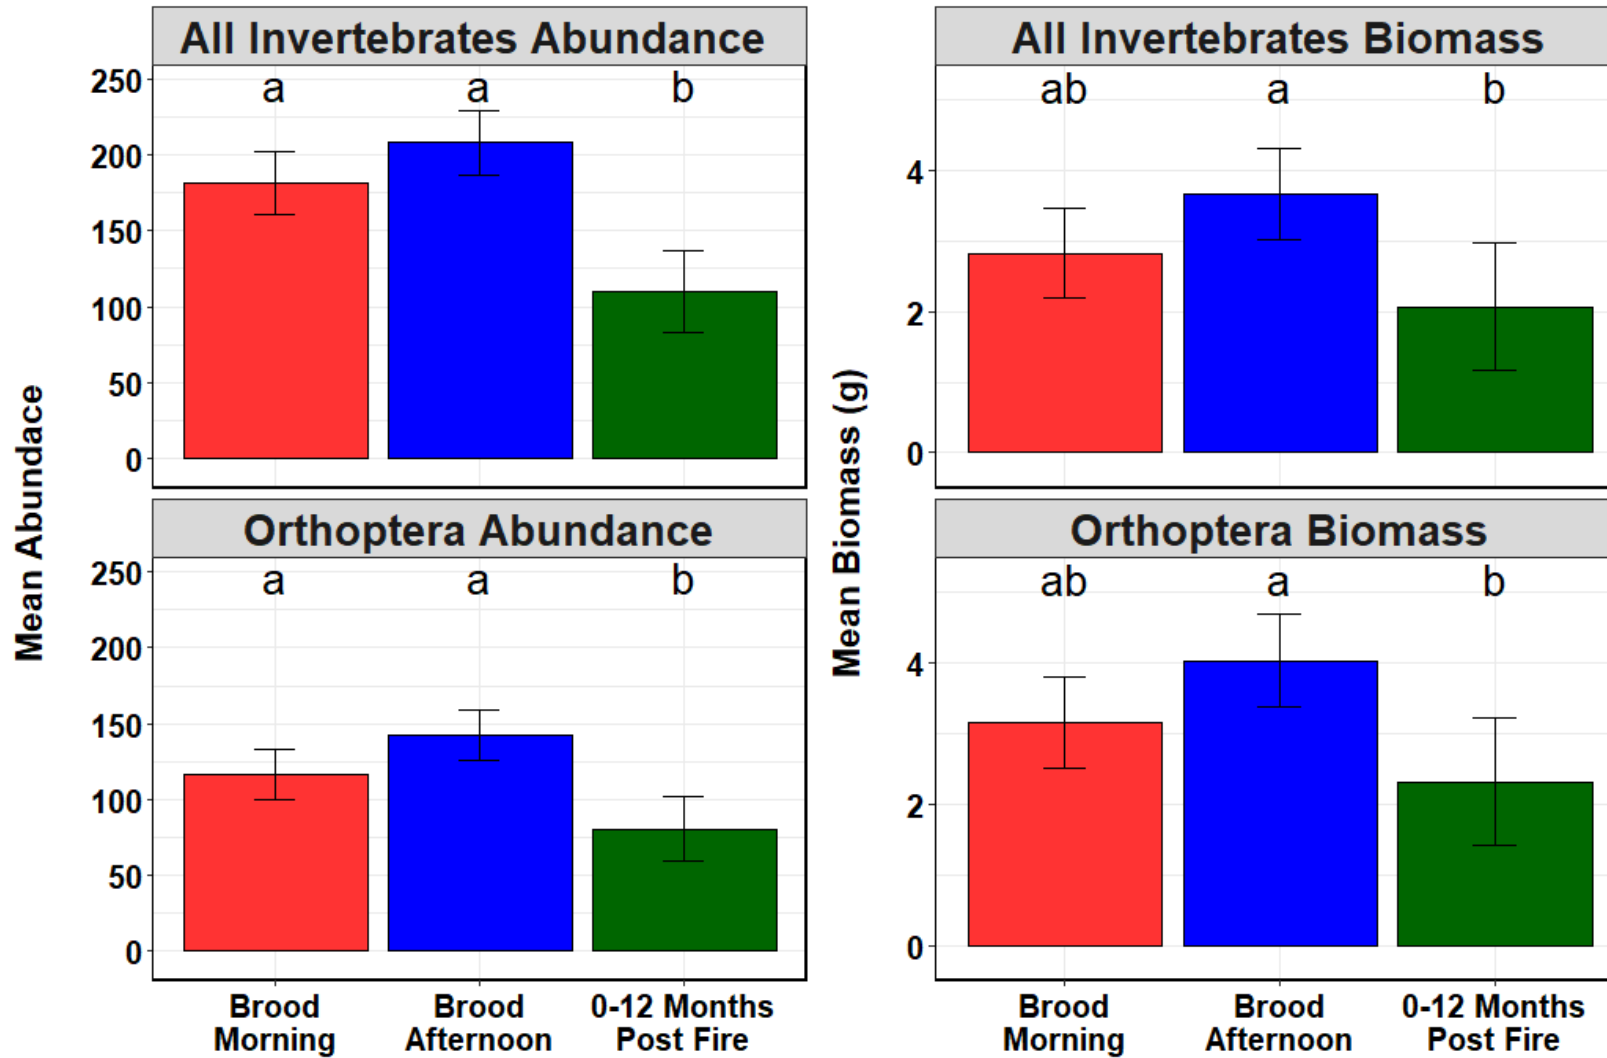

# Patch Level Thermal

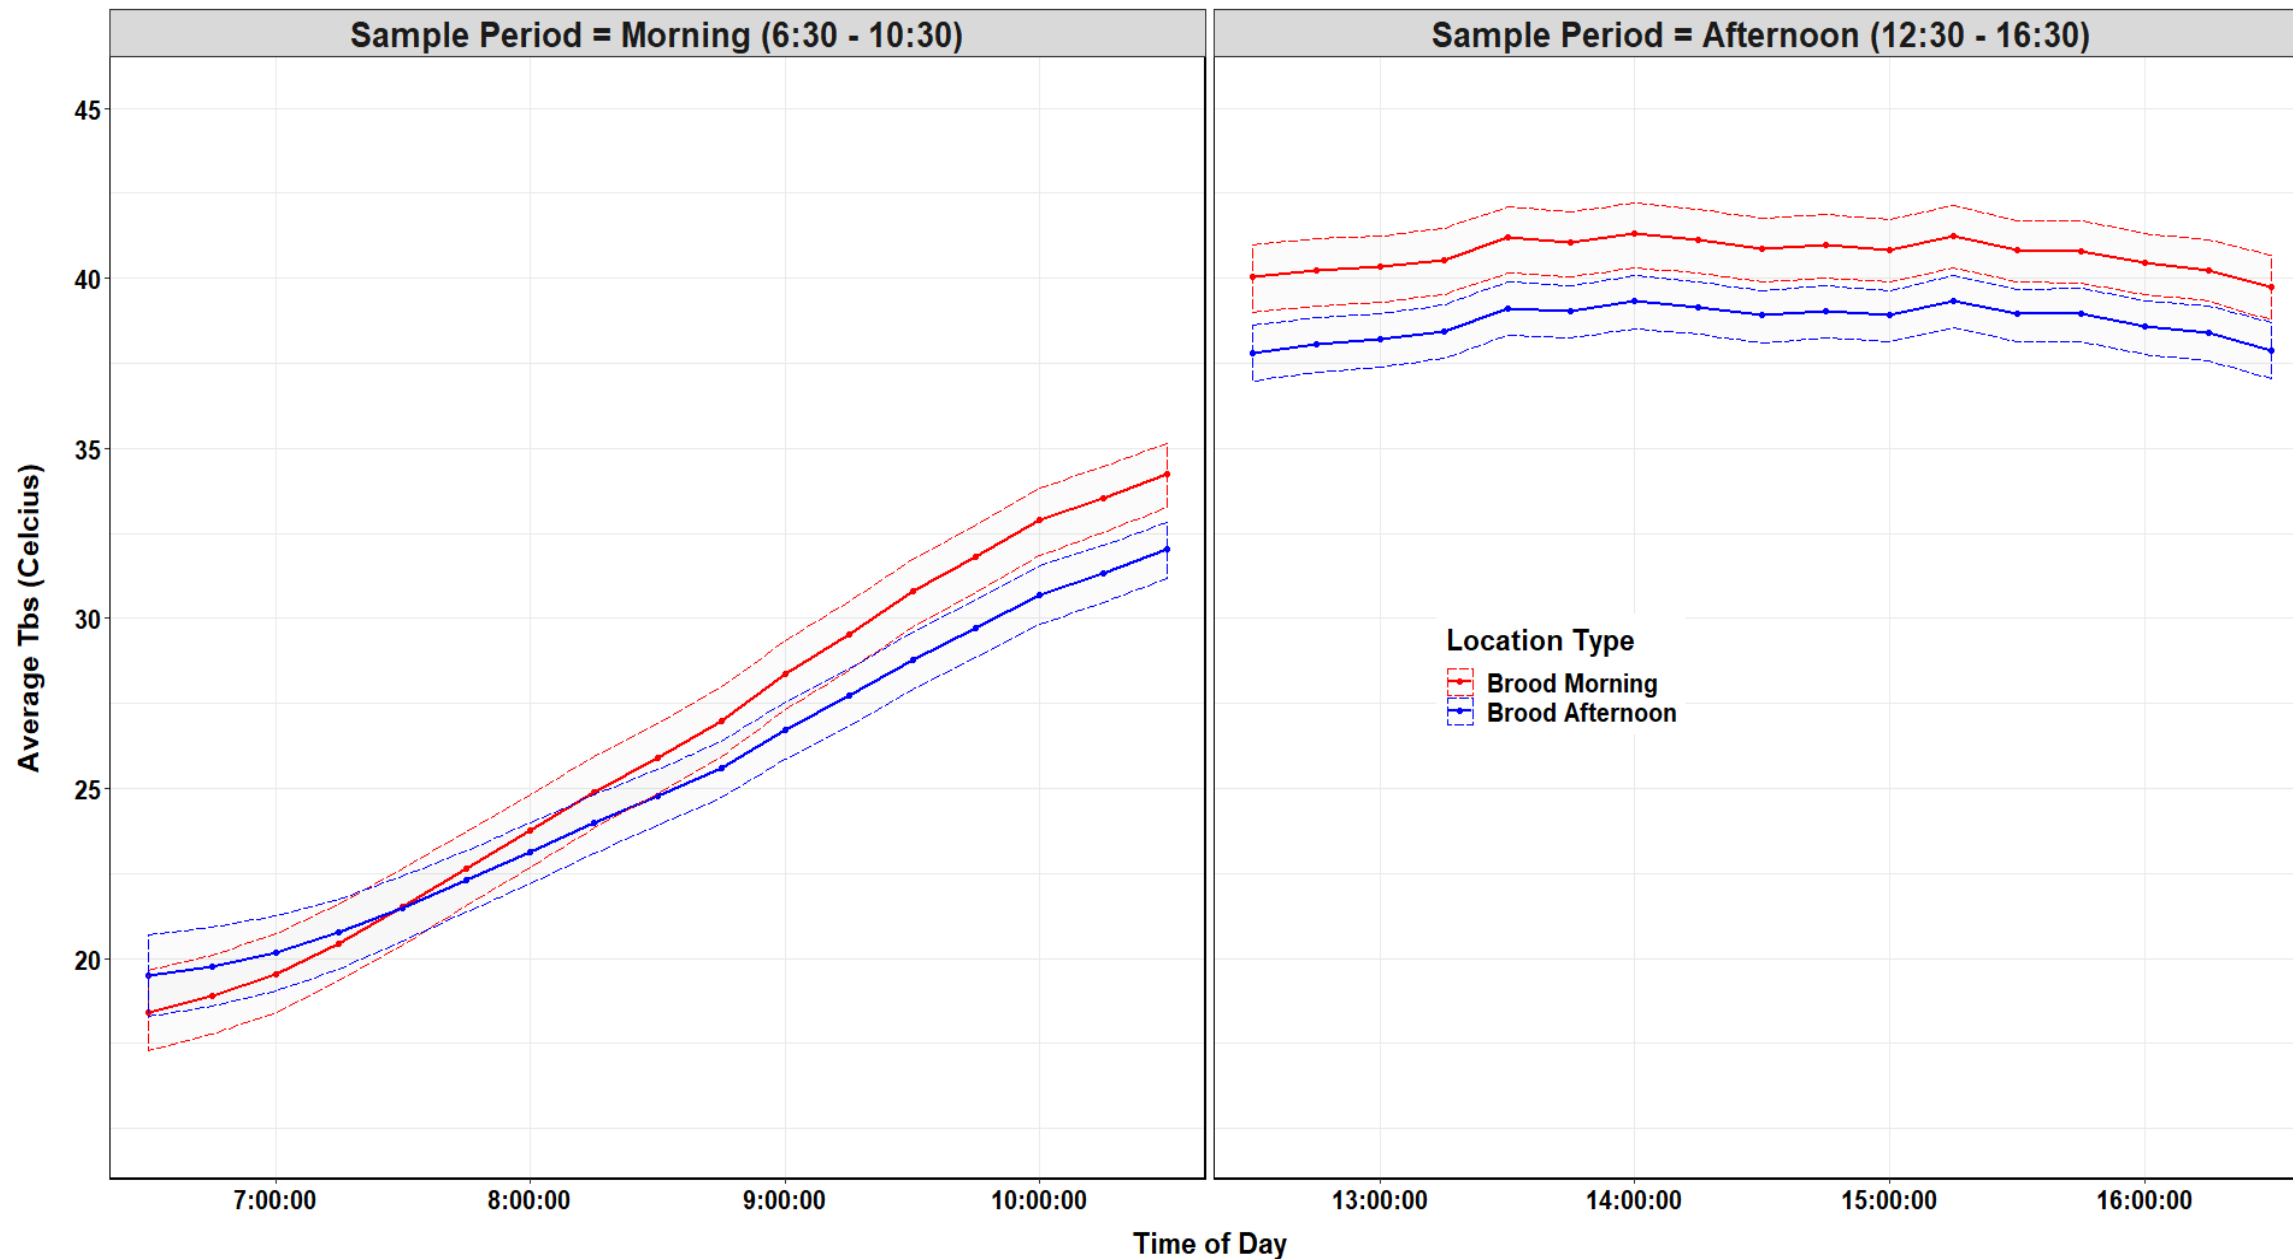

# Brood Locations Vegetation Characteristics

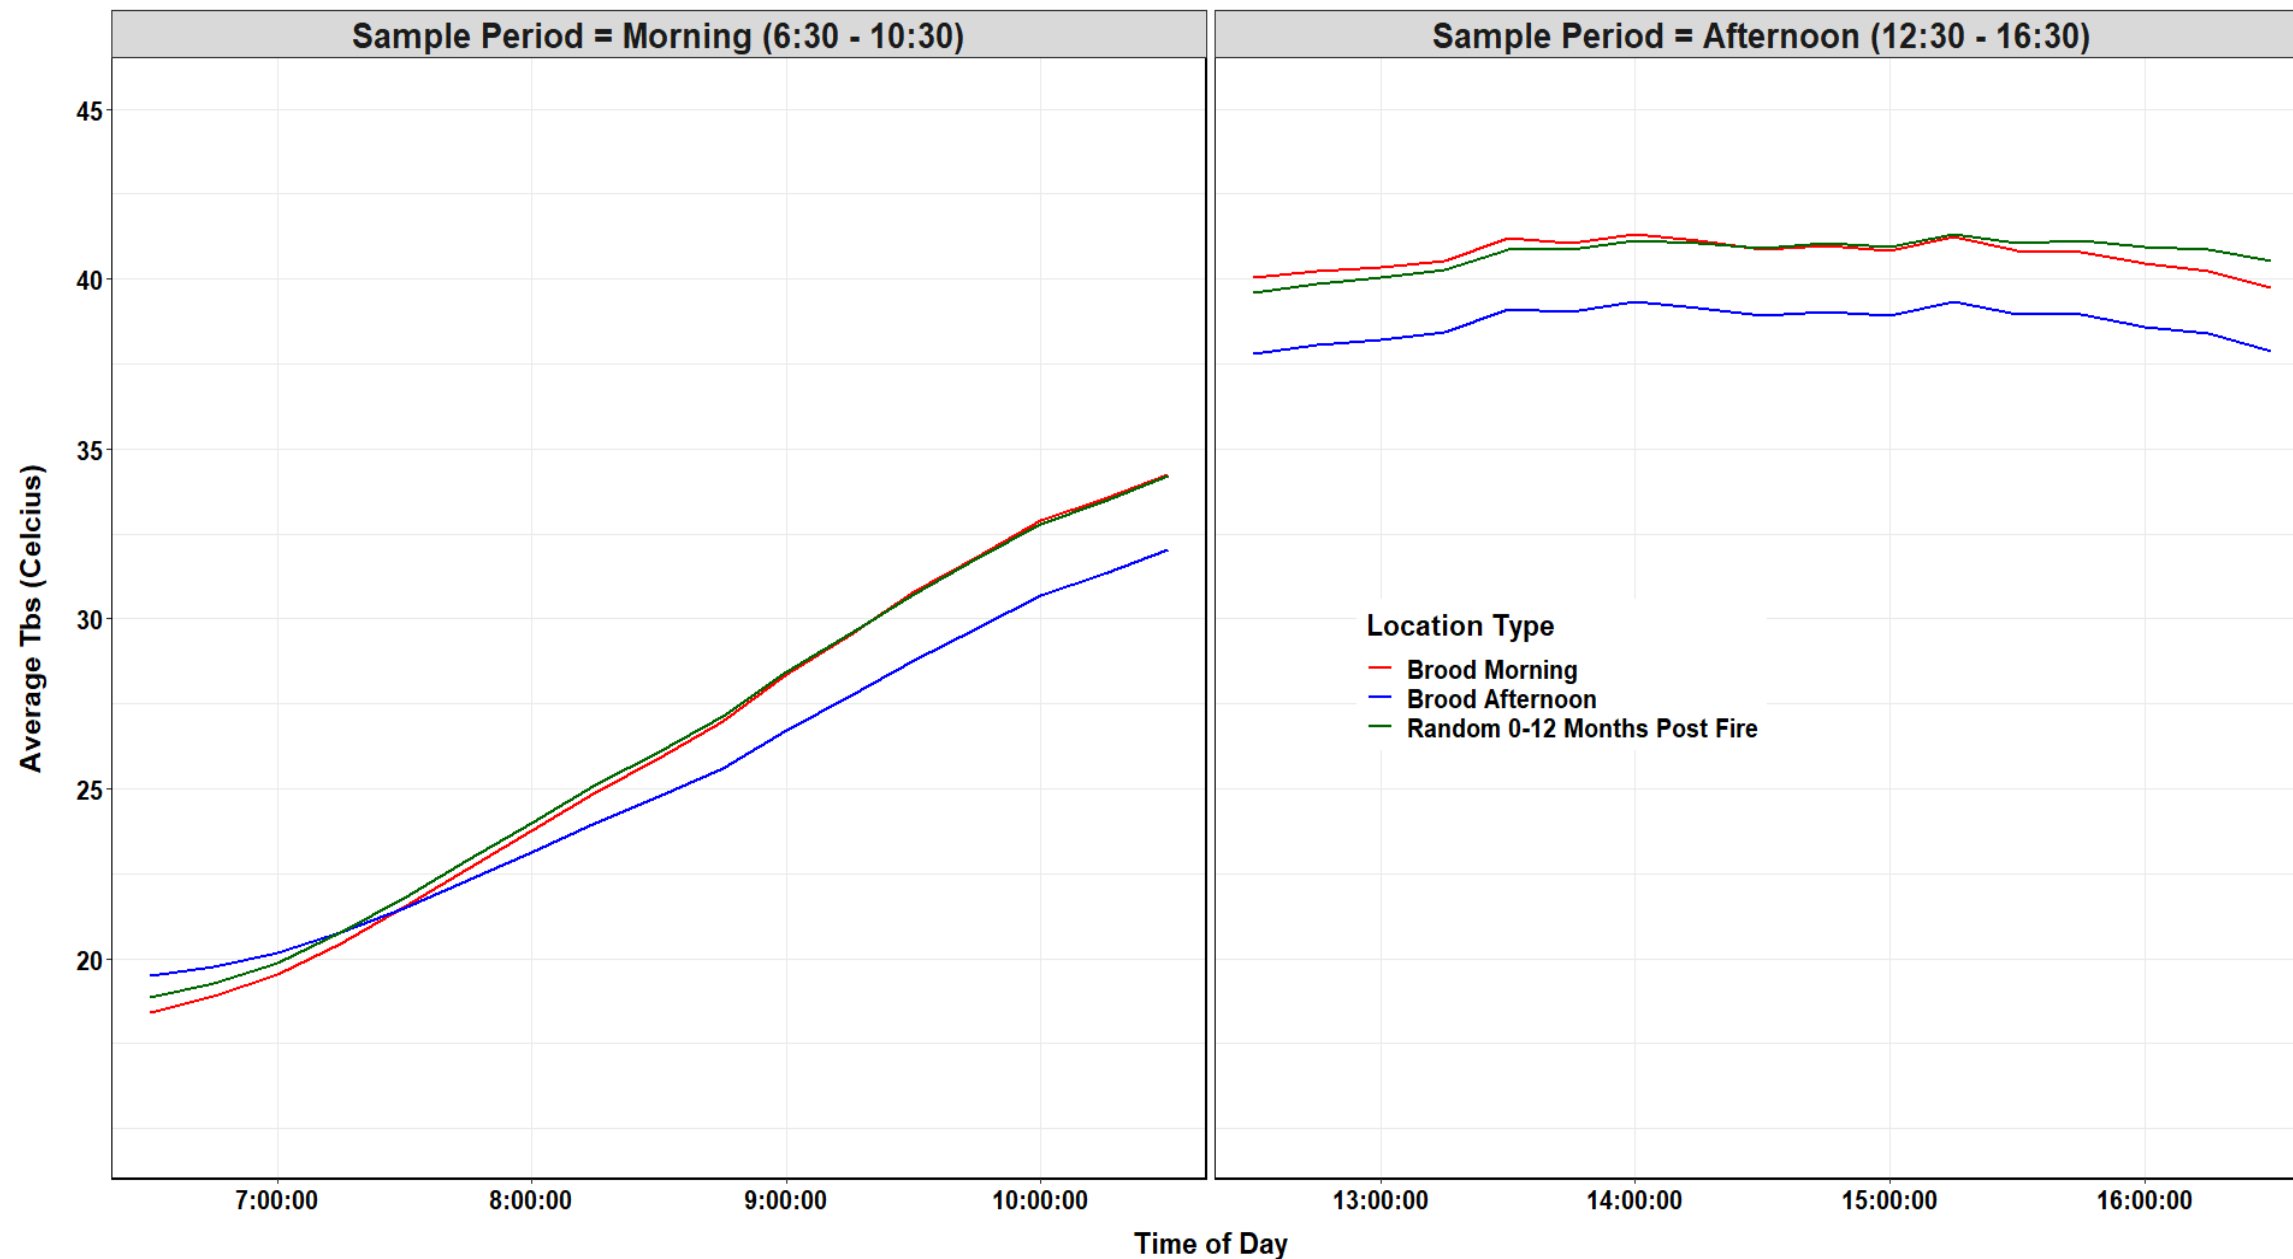

# Brood Location Invertebrates

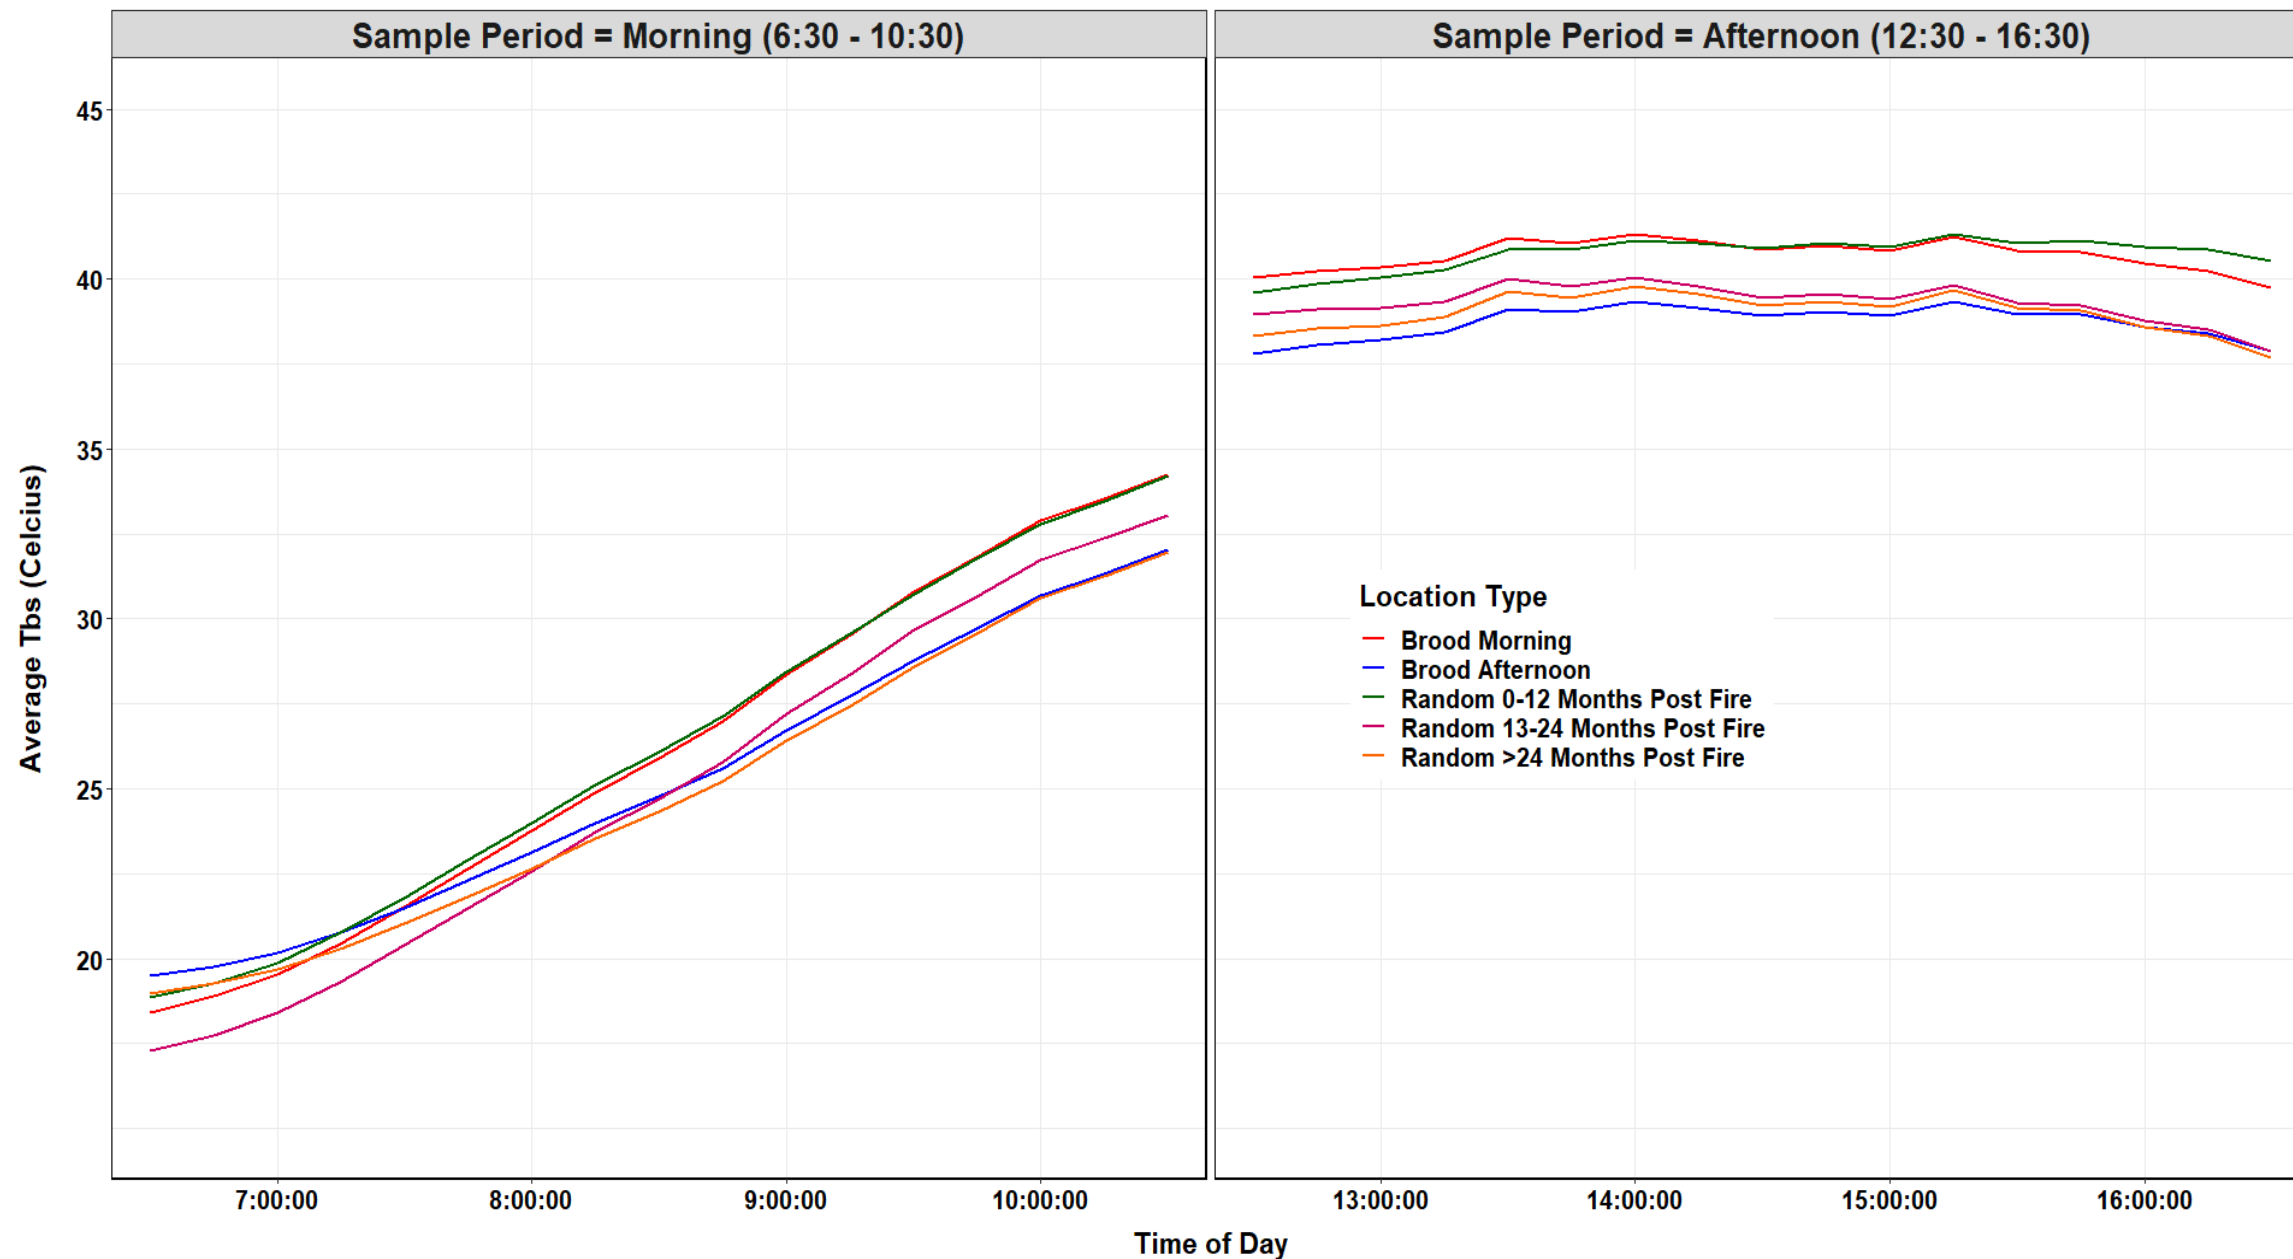

# Brood Location Thermal

# Brood Location Thermal

# Brood Location Thermal

# Conclusions

Grassland heterogeneity important for GRPC broods at multiple scales

Hierarchical Patterns of Habitat Selection

Habitat selection varied through the day

The background of the slide is a sequence of six vertical panels, each showing a bird in flight over a grassy field. The bird is captured in various stages of its wingbeat, with its wings spread wide. The field is covered in tall, dry, yellowish-brown grass. In the distance, there are low, rolling hills under a clear blue sky. The text "Questions?" is centered in the upper half of the image, and "Contact Information: david.londe@okstate.edu" is centered in the lower half.
